Lab 1 : Implementing HTTP Protocol

What is HTTP and How it works ?

The Hypertext Transfer Protocol is an application protocol for distributed systems that allows users to communicate data on the World Wide Web.

As a request-response protocol, HTTP gives users a way to interact with web resources such as HTML files by transmitting hypertext messages between clients and servers.
HTTP clients generally use Transmission Control Protocol (TCP) connections to communicate with servers.
HTTP utilizes specific request methods in order to perform various tasks.
HTTP Protocol is Connectionless & Stateless.

Topology :

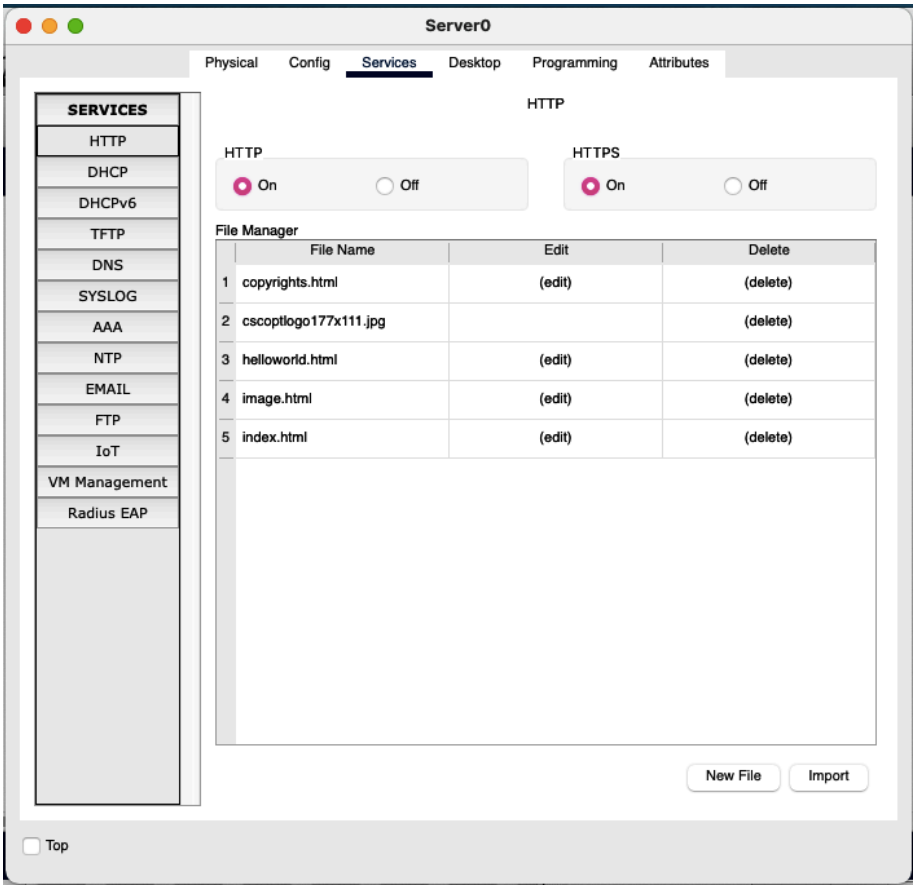

Step 1 :
Get 3 PCs , Switch & Server .

Step 2 : Assign IP addresses for the 3 PCs & Server according to the given Network Address
Assume that :

Server IP is : 10.10.10.1
PC0 : 10.10.10.20
PC1 : 10.10.10.30
PC2 : 10.10.10.40

Step 3 :

Double Click on Server , in Services Tab —> Choose HTTP

Choose index.html & Click (edit) .. Edit the existing HTML Code with :

```
<html>
<h1> We are Implementing HTTP Protocol ... ! </h1>
</html>
```

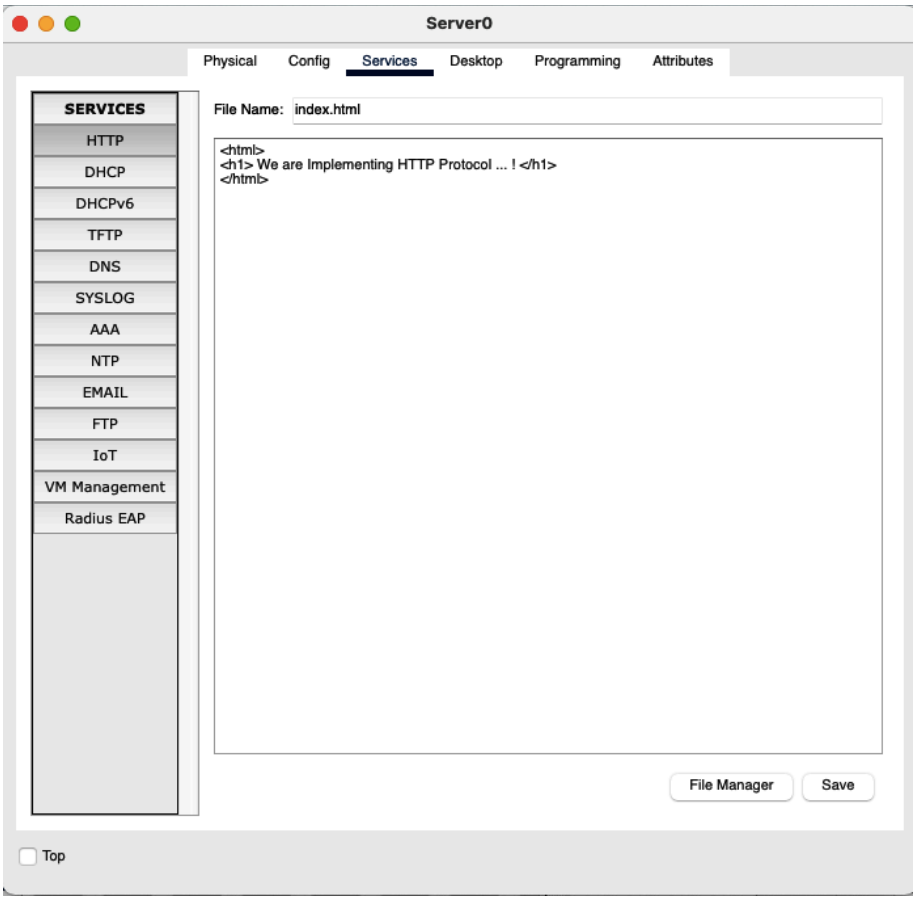

Click on File Manager then **Choose** helloworld.html

You can edit it with any sentence

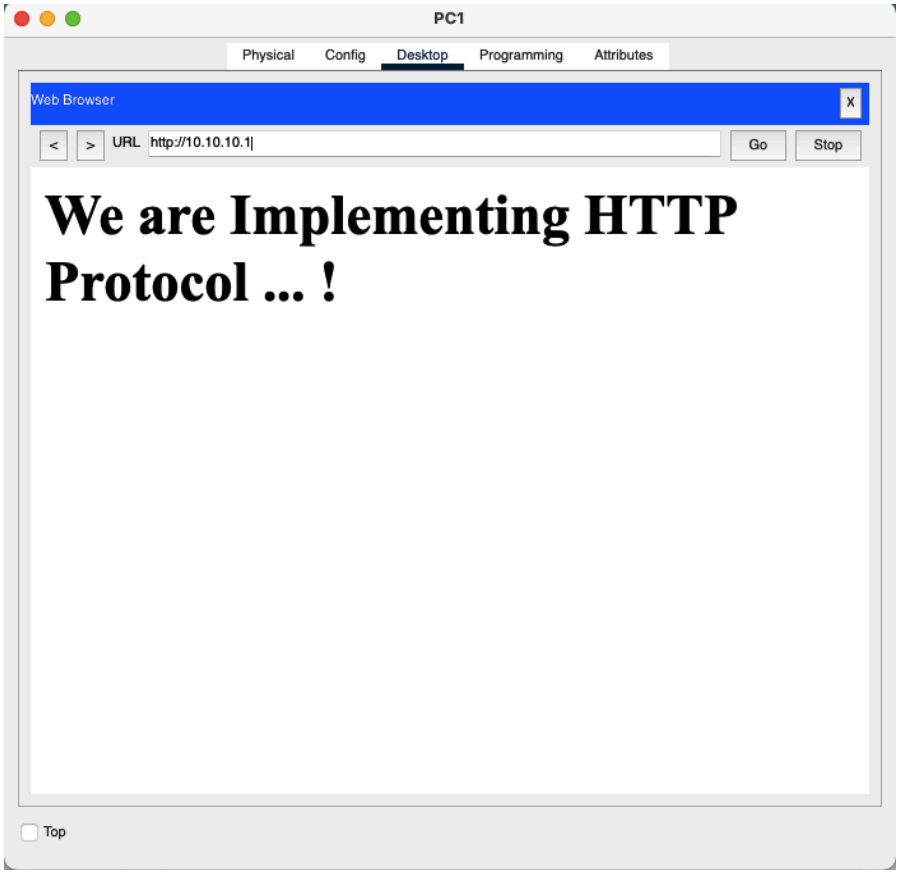

For Example:

```
<html>
Hi ! .. We are Eng. Sara & Hadeer
<br> This is Lab 1 .. ^_^

 <body>
 <p style="color:red">
<br>Hope you enjoy this course ... ❤️</p>
  </body>
<br><a href='index.html'>Back</a>
</html>
```

Step 4:
At any PC go to Desktop —> Web Browser
on the URL Write the IP Address of the Server

Now Try this out :
10.10.10.1/helloworld.html
